

Build Brief — June

What We’re Building

An AI system that reads your Real Vision PDFs daily, extracts and tracks the macro views of your 4 analysts, synthesizes them into a single actionable briefing, and pairs that with mechanical trading signals for your asset universe.

Two components: a **research layer** and a **technical layer**.

Research Layer

Input

1-2 Real Vision PDFs per day. That’s the primary data source.

What It Does

Step 1 — Extraction: Reads each PDF, identifies which analyst is speaking, and pulls out their current positions, claims, and conviction levels — structured against 10 explicit questions:

1. Biggest macro risk next 90 days?
2. Where are we in the liquidity cycle — and what’s your evidence?
3. BTC above or below \$100k by end of Q3 2026? Conviction 1-10.
4. Top 3 highest conviction trades right now — rank 1 to 3 with brief reasoning.
5. What kills your thesis?
6. Rate-sensitive or commodity assets — which do you prefer and why?
7. US equities — add, hold or reduce? Why?
8. What is the market most wrong about right now?
9. Next significant drawdown — 30, 90 or 180+ days?
10. One thing you’re watching that nobody else is talking about.

Step 2 — Thesis Tracking: Every new claim is compared against that analyst’s last known position. The system flags when someone changes their view, reinforces it, or contradicts a prior call. No more reading between the lines across 30 pages — changes surface automatically.

Step 3 — Cross-Analyst Synthesis: The system looks across all four analysts and tells you:
- Where they agree (high conviction signal) - Where they disagree (flag for your attention) - A consensus view with dissent noted

How The 4 Analysts Fit Together

Each analyst serves a different function in the stack:

Analyst	Role	What We Extract
Andreas Steno	Daily weather report	Current regime (inflation × growth × liquidity), liquidity trend, leading indicators
Julien Bittel	The calendar	Current macro season (Spring/Summer/Fall/Winter), allocation shifts, ISM readings

Analyst	Role	What We Extract
Raoul Pal	The map	Cycle position, thesis narrative, structural view on liquidity + crypto
Jamie Coutts	The trigger	Re-entry signals, TD Sequential count, Chameleon state, RSI levels

Highest conviction signal: All four aligned — Steno says bullish regime, Bittel says Spring/Summer, Raoul says Banana Zone, Coutts signals entry. That's when you get an immediate alert.

Output — Daily Briefing

A structured report delivered daily: - Sources ingested that day - Consensus macro view - Key disagreements between analysts - Each of the 10 questions answered with per-analyst attribution - Any thesis changes since last briefing - Strategy recommendations (which flow into the technical layer)

Technical Layer

What It Does

Provides real-time scoring and entry signals for your asset universe: **BTC, HYPE, MU, LIN, UUUU, CRCL, COIN.**

Two different signal sources depending on the asset:

BTC + HYPE — TradingView Webhooks

Uses PineScript alerts firing directly from your TradingView charts. Aligned to Jamie Coutts' re-entry framework:

Signal	Priority
Weekly TD Sequential bar 9	Primary re-entry signal
Chameleon trend reversal to GREEN	Primary confirmation
RSI below 40	Secondary confirmation
Daily TD Sequential bar 9	Shorter-term, not sufficient alone

Scoring: - 4/4 (Weekly TD9 + Chameleon GREEN + RSI <40 + at support) → **Strong buy** — **immediate alert** - 3/4 → **Watch** — **morning brief** - 2/4 or less → **Wait** — **logged only** - **Special:** Weekly TD9 + Weekly Chameleon GREEN together = maximum conviction alert regardless

Requires: Chameleon LV v2.0 (for BTC) and Chameleon HV v2.0 (for HYPE) on your TradingView charts. **Please confirm you have access to these.**

Equities — Python-Calculated Indicators

For MU, LIN, UUUU, CRCL, COIN — indicators calculated directly from market data (Twelve Data API for equities, CCXT for crypto):

Indicator	What It Tells You
TD Sequential	Exhaustion count (1-9), bar 9 = potential reversal
Supertrend	Trend direction — GREEN (bullish) or RED (bearish)
RSI	Actual number (e.g. 38.2), not categories
Support / Resistance	3 levels each, from recent swing highs/lows

Scoring: - **3/3** (TD9 + Supertrend GREEN + RSI <40) → **Buy** — **alert - 2/3** → **Watch** — **morning brief - 1/3 or less** → **Wait**

Note: Supertrend replaces Chameleon for non-TradingView assets. Different indicator, same purpose (trend direction). Chameleon is proprietary and can only be read from your TV charts via webhooks.

Endpoints

Levels check — query any ticker, get back a clean snapshot:

MU - \$355
TD Sequential: 5/9
Supertrend: GREEN
RSI: 38.2
Support: \$340, \$320, \$300
Resistance: \$375, \$395, \$415
Score: 2/3 - WATCH

Signal log — every signal logged with timestamp, price, score, and action. Outcomes recorded 20 days later automatically. This builds your track record over time.

Alerts

When a signal hits threshold, you get an alert immediately (Telegram, or whatever channel you prefer). Morning briefs include all “watch” signals.

How The Two Layers Connect

The research layer feeds into the technical layer: - If all 4 analysts are macro-bullish, technical buy signals carry more weight - If the macro backdrop is deteriorating, technical buy signals get flagged with caution - Strategy recommendations from the research layer (e.g. “Coutts says watch for BTC re-entry”) become active watchlist items in the technical layer

Confirmed

- **Chameleon access** — Chameleon LV v2.0 and HV v2.0 available on TradingView. Full 4-signal scoring for BTC/HYPE.
- **Alerts** — Telegram.
- **Briefing** — Telegram message.
- **Historical data** — 12 months of Real Vision PDFs available for building initial analyst baselines.

Questions For You

1. **Asset list** — BTC, HYPE, MU, LIN, UUUU, CRCL, COIN — anything to add or remove?
2. **Twelve Data** — We need a paid API tier for equity data. Free tier won't be enough for 7 tickers across multiple timeframes.
